EXPERIMENT 9: AI AND ANALYTICS USING ZIA

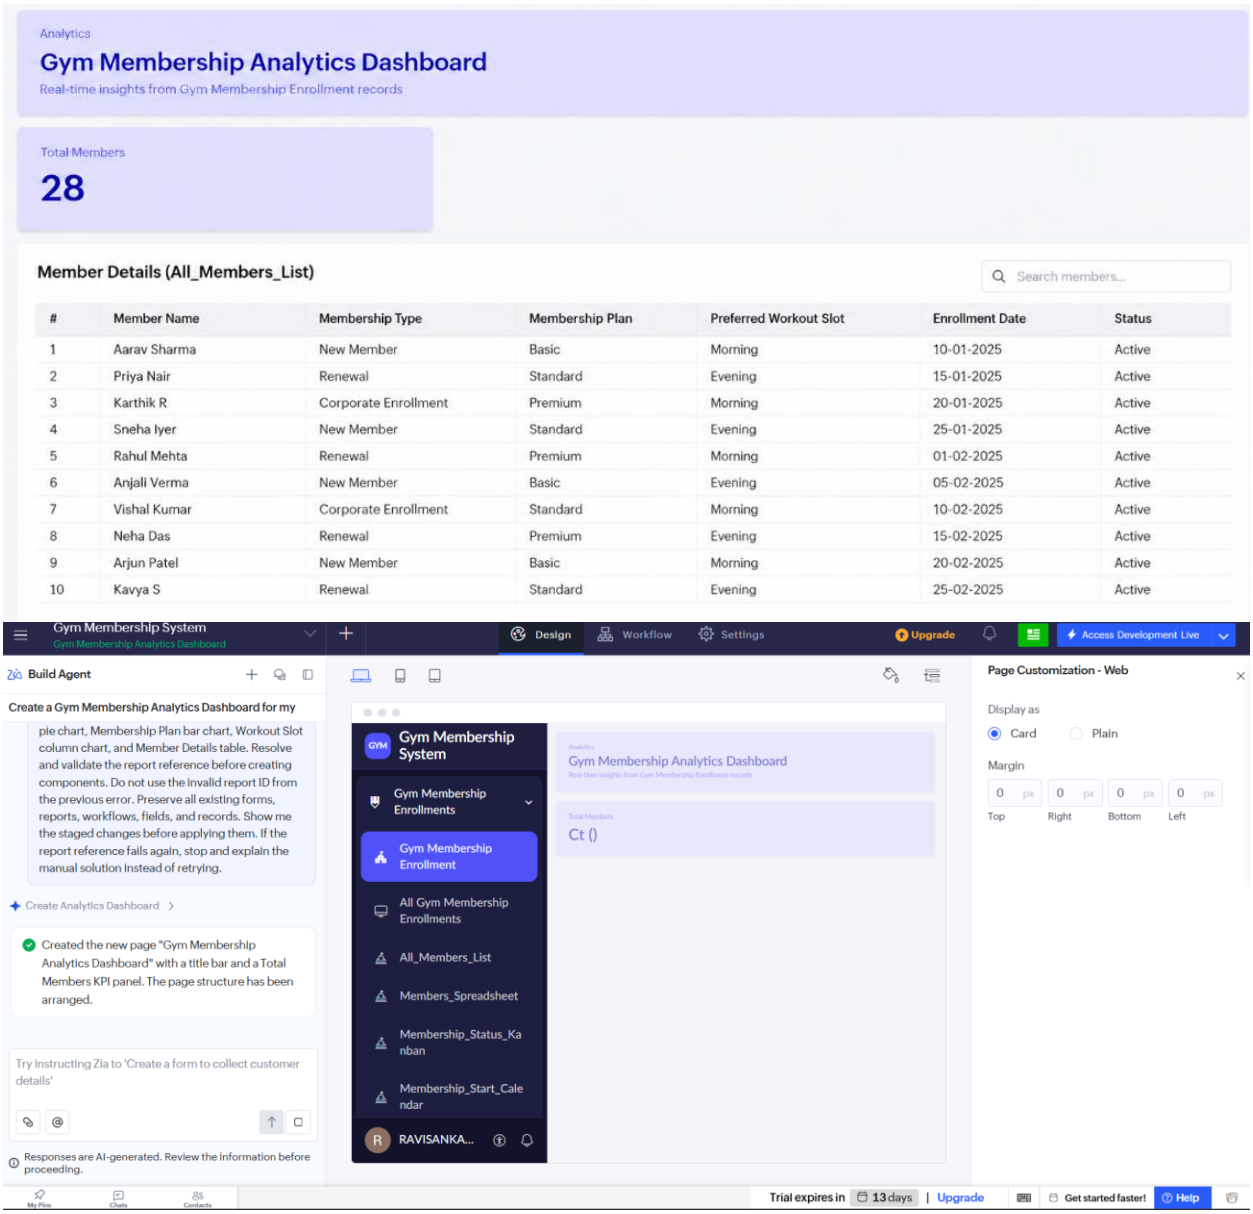

Aim

To develop a Gym Membership Analytics Dashboard using Zia in Zoho Creator to display the total number of gym members and provide access to existing membership records.

Procedure

1. Log in to Zoho Creator and open the existing Gym Membership System application.
2. Open the application editor and navigate to the page builder or the relevant design section.
3. Open the Zia Build Agent to access AI-assisted application development.
4. Provide a prompt requesting an update to the existing Gym Membership Analytics Dashboard using the existing Gym_Membership_Enrollment form.
5. Specify that the dashboard should display a Total Members summary using the actual records in Gym_Membership_Enrollment and, if supported, show the existing All_Members_List report.
6. Instruct Zia not to add charts or graphs and not to create new forms, reports, pages, fields, or sample records. Ask it to preserve existing data and functionality.
7. Review any proposed changes before applying them.
8. Open the Gym Membership Analytics Dashboard and verify the displayed components against the existing membership records.
9. If the Total Members KPI displays an invalid value such as “Ct ()”, check whether its data source or calculation can be configured using a supported record-count method. Do not use “count” as an invented field name.
10. If Zia reports that the existing ZML page cannot be updated automatically, stop retrying the same request and open the page in the Zoho Creator Page Builder for manual configuration.
11. If supported by the page builder, remove unwanted chart elements, configure the Total Members summary, and add the existing All_Members_List report without deleting or modifying existing records.
12. Save and publish the page, then refresh it and verify the results. Capture screenshots of the Zia Build Agent and dashboard for documentation.

SCREENSHOT

Result

Thus, the Gym Membership Analytics Dashboard page was created in Zoho Creator using Zia. The dashboard is intended to display the total number of membership records and the existing All_Members_List report without charts. During verification, the Total Members KPI displayed “Ct ()”, so its record-count configuration and the report display must be checked in the page builder before the dashboard can be considered fully functional.

Note

If the KPI continues to display an invalid value, verify the data source, supported record-count calculation, and existing form/report configuration. A ZML page may require manual editing if the Build Agent cannot reconstruct and update its complete page structure. Do not invent field names or report IDs, and do not modify or delete existing membership data.
